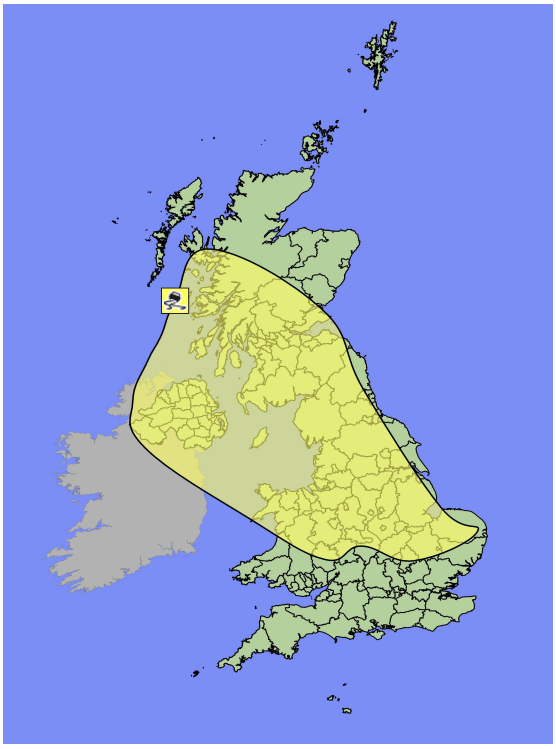
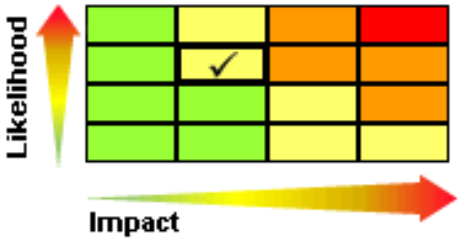
National Severe Weather Warning Service





Chief Forecasters Assessment
A frontal band of cloud and wintry precipitation will slowly drift southwards with cold air following from the north, leading to an ice risk. Timings will be important: the central lowlands of Scotland are perhaps most prone during late Tuesday evening and other areas into Wednesday morning.

The Met Office have issued a **Yellow Warning** of **Ice**

Valid from **16:00 on Tue, 04th Dec 2012** until **12:00 on Wed, 05th Dec 2012**

Outbreaks of rain and sleet will be clearing southwards on Tuesday night and early Wednesday, leaving surfaces wet and prone to freezing as skies clear and temperatures fall. There is also a chance that precipitation could turn to snow locally, this most likely over hills, where a slight cover is possible locally.

The public should be aware of the potential for increased iciness, especially early on Wednesday, and possible disruption to travel.
